                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CB524236
UI-M-GKO-cew-1-22-0-UI.rl NIH_BMAP_GKO Mus musculus cDNA clone
IMAGE:6846599 5', mRNA sequence.
WashU, Human Genetics Division
Mashington University School of Medicine
1st strand of CDNA was synthesized with reverse transcriptase and
1st strand of CDNA was synthesized with reverse transcriptase and
oligo(dT) beads, then CDNA was amplified by PCR using modified
SMART primers. The final CDNA was cloned in pAMP1 vector in
annealing reaction with Uracil DNA Glycosylase (UDG). Library
constructed by Y.Korshunova and M. Lovett. Library materials
provided by J. Gordon lab.
Putative full length read
vector Inength is
Seq primer: -40RP from Gibco

/clone lib="NIH BMAP GKO"
/note="Organ: Brain; Vector: pXX- Asc; Site_1: EcoR I;
Site_2: Not I; The library was constructed according
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured RNA was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with oligo-dr
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with Not! and then cloned
directionally into pXX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is CGANCTGAAT. This library was created for the University
lowa Brain Anatomy Project (BMAP): 'Gene Discovery in the
Developing Mouse Nervous System', supported by National
Institute of Mental Health (NIMH), Hemin Chin, Ph.D.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CONTP) to reduce sequencing redundancy. According to the ONFP procedure, clones giving the same hybridisation pattern with a battery of 200 smc oligonucleotides are grouped into clusters. One clone per cluster is selected for sequencing. The size of each cluster is an indicator of the frequency of a transcript in the analysed library. The cluster size as well the coordinates of the rest of the clones assigned to the same fingerprint cluster as the amphicxus project site at: http://www.molgen.mpg.de/amphicxus/clones and filters are distributed via the Resource Center/Primary PCR PRimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EST 26-AUG-2003

The library was constructed by Claire Murphy and Dr. Makedonka
Dautova at Washington University. St. Louis
(mdautova@watson.wustl.edu). Oligo(dT).Stl Fased library.
Meloidogyne chitwoodi egg cDNA PCR products of size >400
mucleotides containing Stl on the 5' end and oligo(dT) on the 3'
end were non-direction ally cloned into pCRII-TOPO(Invitrogen)
following the Topo TA cloning protocol. Eggs were provided by Dr.
David Bird of North Carolina State University, Raleigh, NC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CD681869

St. Louis. Oligo(dT)-SL1 PCR based library. Meloidogyne
chitwoodi egg cDNA PCR products of size >400 nucleotides
containing SL1 on the 5' end and oligo(dT) on the 3' end
were non-directionally cloned into pCRII-TOPO(Invitrogen)
following the Topo TA cloning protocol. Eggs were provided
by Dr. David Bird of North Carolina State University,
Raleigh, NC (david_bird@ncsu.edu)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EST 13-MAR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BM938356
UI-M-BZ1-bfw-o-15-0-UI.rl NIH BMAP_MH12_S1 Mus musculus cDNA clone
UI.M-BZ1-bfw-o-15-0-UI 5', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 National Institute of Mental Health

/clone lib="mailtimed hapla female SL1 pGEM"
/note="Vector: pGEM-11zf(+) (Promega); Site_1: XhoI;
Site_2: NorI; Cloned unidirectionally. Poly (A)+ RNA was
site_2: NorI; Cloned unidirectionally. Poly (A)+ RNA was
concentrated and purified using Dynabeads (Dynal) and mRNA
eluted for 1ST strand synthesis. 1st strand cDNA created
using mALV RTPOwerScript, Clontech) and primed with
oligo(dT) with XhoI site (primer CDSIII/3-KhoI) and S'
SWART anchor added using chimeric DNA-RNA oligo
(SWART norIr-rGGG). SWART-NorIr-rGGG was used in case a
PCR using the SWART template was also desired. 15 PCR
cycles were done using 1st strand and primers specific to
SL1 leader sequence (SL1-NorI) and 3' and (KNOI-Nor-GT).
dscDNA was digested using XhoI/NorI; fractionated on
Chroma-spin 400 columns (Clontech) and ligated to digested
pGEM -11zf(+) plasmid. Chemically competent cells were
used as host. This library was provided by David Bird's
lab (david birdencsu.edu), of North Carolina State

Bulk tissue was collected from a whole adult individual from the Tuebingen strain. 1st strand cDNA was primed with a Not I - oligo(dT) primer, double-stranded cDNA was cloned into the Not I and EcoRV sites of pExpress-1.
Library was size-selected for >1 kb fragments. A normalized version of this library is also available (NIH ZGC 7). Library was constructed by Open Biosystems (HunEsville, AL)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BUS98654 8822419 NIH_MGC_142 Homo sapiens cDNA clone IMAGE:6457561 5', mRNA Sequence.

Full-length enriched library was constructed using the Clontech crator SMART kit and size-selected to contain the >0.5 kb size fraction (other fractions present in NIH MGC 141). Library created in the laboratory of M. Brownstein (NIM, NIH). Note: this is a NIH_MGC Library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BF339838 RST 22-NOV-2000 02038845F1 NCI_CGAP_Brn64 Homo sapiens cDNA clone IMAGE:4186834

/clone_lib="Sugano mouse brain mncb"
/clone_lorgan: brain; Vector: pWE185-FL3; 1st strand cDNA
was primed with an oligo(dT) primer
ATGTGGCCTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a brail adaptor [GTTGGCCTACTGG], digested and
cloned into distinct brails sites of the pWE185-FL3. Xho!
sites just outside the Drail; sites can be used to isolate
the cDNA insert. Size selection was performed to exclude
fragments <1.5 kb. Library was constructed by Sugano et
al.(University of Tokyo, Institute of Medical Science).

REDO human CDNA sequencing project supported by Ministry of

Economy, Trade and Industry of Japan; CDNA full insert sequencing:

Research Association for Balocechnology (RAB); CDNA fibrary

construction: Halix Research Institute (HRI) (supported by Japan

Key Technology Center etc.); 5'- & 3'-end one pass sequencing: RAB;

HRI, and Blotechnology Center, National Institute of Technology and

Evaluation; clone selection for full insert sequencing: HRI and

RAB; annotation: HRI and RAB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AB060908 10-JAN-2002

R. Sitel: Drall (CACTGTGTG)
R. Sitel: Drall (CACTGTGTG)
Description: 1st strand CACATGTGTG)
Lossription: 1st strand CACATGTG)
Lossription: 1st strand CACATGTG)
Lossription: 1st strand cDNA was primed with an oligo(dT) primer farging specific's and 3 primers and amplified by PCR. The PCR outling specific's and 3 primers and amplified by PCR. The PCR acclude fragments <1.5kD.The Sfil and size selection was performed to exclude fragments <1.5kD.The Sfil-digested PCR product was cloned into distinct Drall sites can be used to isolate the cDNA insert. Libraries were constructed by oligo-capping method (Sugano et al., Institute of Medical Science, University of (Sugano et al., Institute of Medical Science, University of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /translation="MTFERKIQDODKKSKBVSSISNQENENGSGSEEVCYTVINHIP HRRSSLSSNDDGYENIDSLTRKVREFRERSFTEYALLRTSVSRPYSCTHEHDYEVVLP H"

NEDO human CDNA sequencing project supported by Ministry of

Economy, Trade and Industry of Japan; CDNA full insert sequencing:

Research Association for Biotechnology (RAB); CDNA ilbrary

construction: Helix Research Institute (HRI) (supported by Japan

Key Technology Center for); 5- & 3-end one pass sequencing: RAB,

HRI, and Biotechnology Center, National Institute of Technology and

Evaluation; clone selection for full insert sequencing: HRI and

RAB; annotation: HRI and RAB.

On Oct 24, 2002 this sequence version replaced gi:18121511.

During sequence assembly data is compared is used overlapping clones.

Where differences are found these are annotated as variations

rogether with a note of the overlapping clone name. Note that the

variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with

only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality >=

10); an attempt was made to resolve all sequencing problems, such

as compressions and repeats; all regions were covered by at least

one plasmid subclone or more than one M13 subclone; and the

assembly was confirmed by restriction digest. The following

abbreviations are used to associate primary accession numbers given

in the feature table with their source databases: Em: EMBL; Sw:,

SWISSPROT; TI:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AL606804 11near PRI 23-OCT-2002

It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                              Sep 23, 2000 this sequence version replaced gi:9838075.

NEDO human cDNA sequencing project supported by Ministry of

Economy, Trade and Industry of Japan; CDNA full insert sequencing:

Research Association for Biotechnology (RAB); cDNA library

construction: Helix Research Institute (HRI) (supported by Japan

Key Technology Center etc.); 5-6 and one pass sequencing: RAB;

HRI, and Biotechnology Center, National Institute of Technology and

Evaluation; clone selection for full insert sequencing: HRI and

RAB; annotation: HRI and RAB.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         REFERENCE
                                                                                                                                                                                                                                           AC128688
LOCUS
```

```
SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                                                               CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ANNOTATION OF FEATURES:

STSS are identified using ePCR (Genome Res. 7:541-550) searches
GTSS are identified using ePCR (Genome Res. 7:541-550) searches
local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green,
unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST
(Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the
EST and cDNA sequences. Genes demonstrate at least two exons
flanked by consenus splice sites that maintained sequence
continuity across the splice junctions. Sequences that are not
identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annotation.ht

The PCR product was disested with Sfil and size selection was performed to exclude fragments 4.5kb.The Sfil-digested PCR product was obtoned into distinct DrallI sites of pME18S-FL3. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Center: Washington University Genome Sequencing Center

cumboringsanier. ac.uk clone requests clonerequestGasanger.ac.uk on oct 24, 2002 this sequence version replaced gi:1812151.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation and y not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Emi; EMBL; Sw; SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at the feature table with their source databases: Em; EMBL; Sw; Chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping chromosome 1 Mapping abreauting and the found at the feature table with the shanger Centre Chromosome 1 Mapping chromosome 1 Mapping abreauting and a preview of the manner of an he found at the found at the found at the feature table with the sanger Centre Chromosome 1 Mapping abreauting and the found and the found and the found and the found at the feature table with the found at the feature table with the found at the feature farmed from part of bacterial clone contigs of human part of bacterial clone contigs of human part information and the found at the feature farmed and the feature table with the found at the feature farmed and the feature farmed and the farmed and the farmed and the farmed and the farmed and the farmed and the fa
